

## Pollination

To start a new plant, ..... from one flower has to.....

Sometimes wind blows the pollen from one flower to another.

Sometimes ..... or other insects carry the pollen on their bodies.

This is why ..... have bright colours: to attract insects.

When a pollen grain lands on the stigma of the other flower The pollen cell combines with the ovule to make a .....

After this, the sepals, petals and stamens dry up and fall off because they are no longer .....
